Chapter 7 – Applications of Integration 5 The de?inition of the work done by a constant force on a particle is given by the dot product (sometimes called the scalar product) $Work = Force \cdot Displacement$ or $Work = F \cdot (q \cdot p)$ if p is the starting position and q the ending position. Maybe it is no harm to recall a few little things about dot products. If $a = a_1 i + a_2 j + a_3 k$

The Use of Calculus in Engineering. Some engineers directly use calculus in their daily practice and some use computer programs based on calculus that simplify engineering design. Two methods of calculus, differentiation and integration, are particularly useful in the practice of engineering, and are generally used for optimization and summation, respectively.

$a = (dv/dt) = (d^2s)/(dt^2)$. It follows (since integration is the opposite process to differentiation) that to obtain the displacement, s of an object at time t (given the expression for velocity, v) we would use: $s = \int v \, dt$. Similarly, the velocity of an object at time t with acceleration a , is given by:

1. Applications of the Indefinite Integral

One very useful application of Integration is finding the area and volume of "curved" figures, that we couldn't typically get without using Calculus. Since we already know that can use the integral to get the area between the x - and y -axis and a function, we can also get the volume of this figure by rotating the figure around either one of the axes.
