The drive unit is contained in the “moving mass” and creates the vibratory motion. Single-mass units are anchored in position (usually to the floor) and transfer the drive’s vibration directly to the tray or trough through its springs. By using the factory’s floor as a reaction base, a single-mass conveyor can be destructive

Conveyors are material handling systems that allow for easy transporting of products, from powder to bulk to complicated geometries. They are integral to all kinds of systems, as they provide a fast and safe method of handling large volumes of materials. There are many kinds of conveyors, but their working principle remains constant across each type; move objects via gravity or by mechanical ...
