Experiment 1. Measurement and Density. Objective: The objective is to measure the mass densities of a few regular-shaped solid objects (non-porous with no cavities). Equipment: This is the only experiment that requires a fairly sensitive scale (at least good to 1gram precision) and a metric ruler (usually good to 1mm precision).

1 EXPERIMENT 1 Precision of Measurements Density of a Metal Cylinder Physics is a quantitative science, relying on accurate measurements of fundamental properties such as time, length, mass and temperature. To ensure measurements of these properties are accurate and precise, instruments such as a meter sticks, a tape measure, triple-beam balances,

Measurement, accuracy and precision

Accuracy and precision are two important factors to consider when taking data measurements. Both accuracy and precision reflect how close a measurement is to an actual value, but accuracy reflects how close a measurement is to a known or accepted value, while precision reflects how reproducible measurements are, even if they are far from the accepted value.

To find the precision, you basically take the smallest unit on your measuring device, and add a decimal place (the uncertain digit).

Physics 10 Lab 1: Introduction to Measurement Units and Measurement One of the most important steps in applying the scientific method is experiment: testing the prediction of a hypothesis. Typically we measure simple quantities of only three types: mass, length, and time. Occasionally we include temperature, electrical charge or light intensity.

Accuracy and Precision: Accuracy refers to the closeness of a measured value to a standard or known value. For example, if in lab you obtain a weight measurement of 3.2 kg for a given substance, but the actual or known weight is 10 kg, then your measurement is not accurate.

of the precision of repeated measurements. If one takes N measurements of the same physical quantity, the standard deviation, s , is given by: where x_i represents the i measurement and \bar{x} represents the average of all of the measurements. $s = \sqrt{\frac{1}{N} \sum_{i=1}^N (x_i - \bar{x})^2}$ Return to Table of Contents ?
