Updated every hour with fresh content, Centsless Books provides over 30 genres of free Kindle books to choose from, and the website couldn't be easier to use.

### **Understanding Guide Numbers | B&H Explora**

The flash guide number (GN) is a measure of the distance at which the flash can illuminate a subject. The higher the guide number, the greater the distance at which the light from the flash is sufficient for optimal exposure. The formula for calculating the guide number is as follows: Guide number (GN)=distance (meters) × aperture (f-number)

### **Flash Guide Number Equation**

When a guide number is calculated, it is often assumed that the ISO is set to 100, since increased ISO numbers will have an impact on the guide number calculation. Now let's look at some examples. When you're considering a new flash purchase, the only number that the manufacturer provides is the guide number - it's up to you to figure out the other two numbers in the equation.

### **Tutorial: How to use the guide number of your flash**

If you determine the correct direct flash exposure is f/8 at 10.0 feet, then that is Guide Number  $8 \times 10 = \text{GN } 80$ , and it is

## Access Free Flash Guide Number Equation

valid for any combinations multiplying to 80. This computed Guide Number is applicable for whatever ISO and flash power and flash head zoom you were using to determine it.

### **Flash guide number f/stop calculation - Photography Stack ...**

Guide Number = Shooting Distance  $\times$  f-number  $\div$  ISO factor  
This formula tells you what GN you'll need from your flash at that distance and with those settings. You can also rearrange the terms; for example, if you have a basic flash with a fixed guide number, and your subject distance is also fixed, you might want to put those terms on the same side, so you can just calculate some number on that side:

## Access Free Flash Guide Number Equation

### **Guide number - Wikipedia**

Guide numbers are the standardized, numerical way of determining the power of a flash, with a higher guide number representing a more powerful flash. A guide number is the product of multiplying the f/stop of an exposure with a given distance, at ISO 100; or  $GN = f/\text{number} \times \text{distance}$ .

### **Derivation of the Effective Guide Number formula**

Using the guide number 100, the f/number setting for 5 feet is  $100 \div 5 = 20$ . Thus we would set the camera to aperture f/20. For a subject 25 feet distant, the math is  $100 \div 25 = 4$ . Thus we set the aperture to f/4.

### **Algebra 1 Pre Final Guide Flashcards | Quizlet**

## Access Free Flash Guide Number Equation

Now, with the  $GN = \text{aperture} \times \text{distance}$ , then the Guide Number of 110 implies that at full power (with the flash-head zoomed to around 35mm), we need:  $110 = 11 \times \text{distance}$  The 11 is the f/11 for the bright background, as implied by the Sunny 16 Rule. So now we see we have to hold the flash 10 feet away from our subject.  $110 = 11 \times 10$

### **Flash Guide Number**

Using the guide number to calculate flash exposure. Guide Number: 197? (60 m) at ISO 100 ... for the flash-head zoomed to 200mm Guide Number: 118? (36 m) at ISO 100 ... for the flash-head zoomed to 35mm The GN of 118 is close enough to the Nikon's that the explanation is the same for 35mm flash-head zoom.

### **Understanding Camera Flash Guide Numbers, plus GN Calculator**

Guide numbers are based on a simple mathematical equation that states: the light output of an electronic flash is equal to the distance of the flash unit from the subject multiplied by the lens aperture, or f/stop.

### **Flash Photography - Understanding Guide Numbers**

GN 1 is the published guide number of the flash unit, and GN 2 is the effective guide number we will calculate based on the flash power level setting. The second step in our adaptation of the formula is to observe that  $I_1 / I_2$  is a ratio between two intensities.

### **Guide Number Misconceptions / Understanding Flash Power on Strobes & Speedlights**

Following the formula,  $GN=f\text{-stop} \times \text{distance}$ , you'd have  $GN= f8 \times 10 \text{ feet}$  or  $GN$  of 80. Just to drive the point home, the  $GN$  for ISO 200 film would be 160 since you gain a stop of light with the faster film, so  $GN= f16 \times 10 \text{ feet}$  or 160. High guide number flashes provide a greater reach or working distance for a flash.

### **Flash Level (Guide Number) - Nikon | Imaging Products**

Explaining the math behind a flash's guide number, how it relates to f-stop, and more practical formulas for nailing exposure on your strobes & speedlights. Thanks for watching!
