In Stata 14.2, we added the ability to use margins to estimate covariate effects after gmm. In this post, I illustrate how to use margins and marginsplot after gmm to estimate covariate effects for a probit model.. Margins are statistics calculated from predictions of a previously fit model at fixed

Using the Margins Command to Estimate and Interpret ... margins. all by itself, Stata will calculate the predicted value of the dependent variable for each observation, then report the mean value of those predictions (along with the standard error, t-statistic, etc.). If margins is followed by a categorical variable, Stata first identifies all the levels of the categorical variable.
