Refractory review | World Cement

Refractory materials, like all solids, expand on heating, the degree of expansion being related to the chemical composition of the refractory. Magnesium oxide has the highest coefficient of expansion of the refractory materials commonly used. Silicon carbide has a comparatively low coefficient of expansion and fused or vitreous silica has the lowest expansion of all the refractory materials ...

A superalloy, or high-performance alloy, is an alloy with the ability to operate at a high fraction of its melting point. Several key characteristics of a superalloy are excellent mechanical strength, resistance to thermal creep deformation, good surface stability, and resistance to corrosion or oxidation.. The crystal structure is typically face-centered cubic (FCC) austenitic.
