SDMetrics currently features the following UML design metrics. The metrics cover information collected from class, package, object, and composition structure diagrams, communication and sequence diagrams, statechart and activity diagrams, as well as use case, deployment, and component diagrams. The list shows the metrics for UML2.

A Metrics Suite for Object Oriented Design

The object-oriented paradigm shows some peculiarities when compared with traditional software development. This is particularly apparent when one considers that object-oriented system development supports prototyping, and uses its own object-oriented programming languages and tools.

Abstract: Object oriented design, is becoming very popular in software development environment. Object oriented design metrics is an essential part of software environment. Object oriented measurements are used to measure quality of software. The metrics for object oriented design focus on measurements

Analysis of Object Oriented Metrics

It is often difficult to determine which metric is more useful in which area. As a consequence, it is very difficult for project managers and practitioners to select measures for object-oriented systems. In this paper we investigate 22 metrics proposed by various researchers.

Object-oriented metrics : measures of complexity (Book ... In 1994 Robert "Uncle Bob" Martin proposed a group of object-oriented metrics that are popular until now. Those metrics, unlike other object-oriented ones don't represent the full set of attributes to assess individual object-oriented design, they only focus on the relationship between packages in the project.

SDMetrics - List of object-oriented metrics and OO measures
Lines of code and functional point metrics can be used for estimating object-oriented software projects. However, these metrics are not appropriate in the case of incremental software development as they do not provide adequate details for effort and schedule estimation. Thus, for object-oriented projects, different sets of metrics have been proposed.

The Measure-Object cmdlet calculates the property values of certain types of object. Measure-Object performs three types of measurements, depending on the parameters in the command. The Measure-Object cmdlet performs calculations on the property values of objects. You can use Measure-Object to count objects or count objects with a specified Property.
