The TRIAC is a semiconductor switch and the switch is turned ON by using the triggering pin. Once the semiconductor switch is turned ON, then the current drops lower than the hold-on value. By delaying the turn-on point for some time after the voltage crosses zero volts - the zero-cross point - the voltage can be adjusted although it is no longer sinusoidal.

1. Triac turns OFF when the voltage is reduced to zero. 2. Single gate controls conduction in both directions. 3. Triac with high voltage current ratings are available. 4. Triac is a bidirectional device, it conducts in both direction. Disadvantages of TRIAC. 1. Gate has no control over conduction once Triac is turned ON as in the case of an ...

TRIAC Construction. The triac is a three-terminal bi-directional thyristor. It was developed as a device to control AC power. The triac replaces a pair of inverse parallel-connected SCRs. For low-to medium-current applications (up to about 100 A) the triac is less costly than two SCRs.

Opto-triacs summary. Opto-triacs or solid-state relays (SSR) consist of an infra-red LED and a triac in one package. The LED is switched on and off by a low-power DC control circuit and this switches the triac which can be used to control AC devices up to mains voltages.

How to Test TRIAC with Multimeter - Instrumentation Tools
The on-state characteristic of the triac is similar to that of a thyristor and is shown in Fig. 6. Table 1 and Fig. 7 summarise the different gate triggering configurations for triacs. Due to the physical layout of the semiconductor layers in a triac, the values of latching current (IL), holding current (IH)

CHAPTER 6 Power Control with Thyristors and Triacs
TRIAC, atau Triode for Alternating Current (Trioda untuk arus bolak-balik) adalah sebuah komoromen elektronik yang kira-kira ekuivalen dengan duaSCR yang disambungkan antiparalel dan kaki gerbangnya disambungkan bersama. Nama resmi untuk TRIAC adalah Bidirectional Triode Thyristor. Ini menunjukkan sakelar dwiarah yang dapat mengalirkan arus listrik ke kedua arah ketika dipicu (dihidupkan).

Assuming a triac gate trigger current IOT = 50 mA and a required load voltage of 30 V: The snubber circuit in this example is designed to meet the dV/dt rating of the phototriac. If the dV/dt rating of the main triac is different, the worst case value has to be chosen for designing the snubber network.

The Triac Basically, a triac can be thought as two SCRs connected in parallel and in opposite directions with a common gate terminal. Unlike the SCR, the triac can conduct current in either direction when it is triggered on, depending on the polarity of the voltage across its A 1 and A 2 terminals.

Taking it as a interrupt we can easily design a micro-controller based system which can generate a gate firing signal. And this signal will trigger the gate of the TRIAC. But a problem occurs again. The micro-controller works at 5V DC on the other hand the TRIAC works at 220V AC. So how can I trigger the TRIAC with MCU?
