Geotechnical centrifuge modeling - Wikipedia

Principles of Centrifuge Modeling Typical Applications A geotechnical centrifuge is used to conduct model tests to study geotechnical problems such as the strength, stiffness and capacity of foundations for bridges and buildings, settlement of embankments, stability of slopes, earth retaining structures, tunnel stability and seawalls.

Dynamic Centrifuge Modeling of Geotechnical Structures

A centrifuge is a piece of equipment that puts an object in rotation around a fixed axis (spins it in a circle), applying a potentially strong force perpendicular to the axis of spin (outward). The centrifuge works using the sedimentation principle, where the centripetal acceleration causes denser substances and particles to move outward in the radial direction.

centrifuge. The principles of centrifuge modeling are now widely established and have been documented in detail. A set of scaling laws relates the observed behavior of the models to the prototype structures in the field. The scaling laws reveal some advantages of centrifuge modeling. For example, the scaling law for energy is 1/n³

Principles of centrifuge modelling The constitutive behaviour of soil is highly non-linear and stress level dependent. To simulate accurately in a physical model (commonly called model), the behaviour of a full scale geotechnical structure (commonly called prototype) and the in-situ stresses must be reproduced in the model.

Similitude laws in centrifuge modelling - SERIES

'Geotechnical centrifuge modeling' is a technique for testing physical scale models of Geotechnical Engineering systems such as natural and man-made slopes and earth retaining structures and building or bridge foundations. The scale model is typically constructed in the laboratory and then loaded onto the end of the centrifuge, which is typically between 0.2 and 10 m in radius.

A centrifuge is a piece of equipment that puts an object in rotation around a fixed axis (spins it in a circle), applying a force perpendicular to the axis of spin (outward) that can be very strong. The centrifuge works using the sedimentation principle, where the centrifugal acceleration causes denser substances and particles to move outward in the radial direction.
