How to use lists in R | R-bloggers

`ReadList["file"]` reads all the remaining expressions in a file and returns a list of them. `ReadList["file", type]` reads objects of the specified type from a file, until the end of the file is reached. The list of objects read is returned. `ReadList["file", {type1, type2, ...}]` reads objects with a sequence of types, until the end of the file is reached.

To Read – Reading List - Apps on Google Play

Creating a list using `lapply()` You don't need to have a list already created to use `lapply()` – in fact, `lapply()` can be used to make a list. This is because the key about `lapply()` is that it returns a list of the same length as whatever you input.. For example, let's initialize a list to have 2 empty matrices that are size 2×3 .

ReadList—Wolfram Language Documentation

So now we know how to open a file, read the lines into a list, and locate a substring in any given element of that list. Let's use this knowledge to build some example programs. Print all lines containing substring. The program below reads a log file line by line. If the line contains the word "error," it is added to a list called errors. If

How to Extract Specific Portions of a Text File Using Python

How to Read a Book is a 1940 book by the philosopher Mortimer J. Adler. He co-authored a heavily revised edition in 1972 with the editor Charles Van Doren, which gives guidelines for critically reading good and great books of any tradition. The 1972 revision, in addition to the first edition, treats genres (poetry, history, science, fiction, et cetera), inspectional and syntopical reading.
