A robust stability margin greater than 1 means that the system is stable for all values of its modeled uncertainty.

A robust stability margin less than 1 means that the system becomes unstable for some values of the uncertain elements within their specified ranges.

This paper focuses on the problems of robust stability and stabilization and robust control for uncertain singular Markovian jump systems with  $(x,v)$  dependent noise. The parameter uncertainties appearing in state, input, disturbance as well as diffusion terms are assumed to be time varying but norm bounded.
