Seismic Performance of a Cable-stayed Footbridge Using a ...

In this study, the longitudinal seismic fragility of a five-span cable-stayed bridge with tall piers is investigated using the fragility method. The OpenSees is applied to develop a finite element model of the cable-stayed bridge, and both the geometric and material nonlinearities are considered.

Cable Supported Bridges Earthquakes Performance and ...

The seismic performance of a cable-stayed bridge in different fault regions has been evaluated. A larger deformation and strength demand are necessary for the bridges in MR. The deformation demand is essential for the towers in FR, whereas THE strength demand should be a priority for the towers in BR.

Seismic Fragility Assessment of an Isolated Multipylon ...

For a bridge located in a seismically active and flood-prone region, the occurrence of earthquakes combined with flood-induced scour is a highly possible multihazard event. This study quantifies the scour effect on the seismic performance of a single pylon cable-stayed bridge under bidirectional earthquake excitations.

Seismic Response of Single Pylon Cable-Stayed Bridge under ...

Seismic studies of suspension and cable-stayed bridges suggest that seismic demands on the towers are dominated by inertial forces originating in the towers themselves. Therefore, eliminating the center tower virtually eliminates a third of the seismic demands and therefore provides a substantial savings in achieving seismic resistance.

Seismic performance of semi-rigid base connection model of cable-stayed bridge tower Shehata E. Abdel Raheem, Toshiro Hayashikawa. International Journal of Civil and Structural Engineering Volume 3 Issue 2 2012 347 these connections are semi-rigid and the real condition lies between these two extreme cases.

Seismic energy dissipation for cable stayed bridges using ...

Damping ratio of cable stayed bridge is between 1-2% and suspension bridge is 1.5 to 2% and these values are well below 5% critical damping used for bridge seismic analysis. So, when the bridge experiences an earthquake, its vibration need long time to disappear.

Seismic fragility assessment of a multi-span cable-stayed ...

A real multispan cable-stayed bridge is selected as representative layout for the experimental seismic performance assessment. A suite of 8 ground motions is used with six different PGA levels for seismic input. A total of 48 shakings are performed during the whole test campaign.

First, the dynamic properties of the footbridge, i.e. its natural frequencies, modes shapes and damping ratios, were estimated. The validation of the obtained results was then conducted. In the last stage of the study, the seismic performance of a cable-stayed footbridge using a concrete damage plasticity model was prepared.

Seismic Performance of Cable-Stayed Bridge Towers ...

Like suspension systems in suspension bridges, stays are the strongest part of cable stayed bridge during earthquakes. It should be said that, the resistance of towers in cable stayed bridges against seismic forces are greater than that of suspension bridges. This is because of the cables which are work like bracings.
