Real Time Software Engineering (CpE 291 A) In computer science, real-time computing (RTC), or reactive computing describes hardware and software systems subject to a "real-time constraint", for example from event to system response. [irrelevant citation] Real-time programs must guarantee response within specified time constraints, often referred to as "deadlines".

Real Time Software Design in Software Engineering SE13 As @mouviciel already said, real-time and fast are really two independent properties, even though many real-time deadlines imply that a relatively fast response is needed. When writing real-time software, the most important property next to a correct response is that you can accurately predict how fast the response will be given.
