Work, Energy and Power Definition, Units, Formula ...

Work. refers to an activity involving a force and movement in the direction of the force. A force of 20 newtons pushing an object 5 meters in the direction of the force does 100 joules of work. Energy. is the capacity for doing work. You must have energy to accomplish work - it is like the "currency" for performing work.

Energy, Work and Power

In physics, power is the rate of doing work or of transferring heat, i.e. the amount of energy transferred or converted per unit time. Having no direction, it is a scalar quantity. In the International System of Units, the unit of power is the joule per second (J/s), known as the watt (W) in honour of James Watt, the eighteenth-century developer of the condenser steam engine.

Work, Energy, and Power: Crash Course Physics #9

Work, Energy and Power. Definitions. Work can be defined as transfer of energy. In physics we say that work is done on an object when you transfer energy to that object. If one object transfers (gives) energy to a second object, then the first object does work on the second object.

To be specific, power is defined as the work done divided by the time that it took to do that work. We already said that both weightlifters are doing 1,960 joules of work. The weightlifter on the right takes 1 second to lift his weights, and the weightlifter on the left takes 3 seconds to lift his weights.

Therefore work =power × time. Energy =power × time. Efficiency Of A Machine: Efficiency of a machine is a ratio of output work to input work. It shows the percentage of output work from the input work. No machine is hundred percent efficient because there is always energy in the form of heat and sound.

This also means the constraint forces do not add to the instantaneous power. The time integral of this scalar equation yields work from the instantaneous power, and kinetic energy from the scalar product of velocity and acceleration. The fact that the work–energy principle eliminates the constraint forces underlies Lagrangian mechanics.

Power Power is a rate of doing work. It is a measure of how quickly work is done. For a quantity of work W that is done in an amount of time t, the power done is, The unit for power is the Watt (W), which is equal to a Joule per second, 1 W=1 J/s Power can also be expressed in as force F times velocity v.
